Marine Biome Project

Claire Wendorf

What is a marine biome?

The Marine biome is the largest biome in the world. It covers 70% of the surface of our planet. It includes the oceans: Pacific, Atlantic, Indian, and the Arctic. Most marine biomes are really salty. There are many varieties of plants and animals in the marine biome. There are 3 different vertical zones they can live in, and the type of plant or animal depends on where they live in the ocean. We need to take care of our ocean because it influences weather and we eat things from the ocean.

Abiotic and Biotic Factors in the marine biome

ABIOTIC:

Rocks

Sand

Oxygen

Sun

BIOTIC:

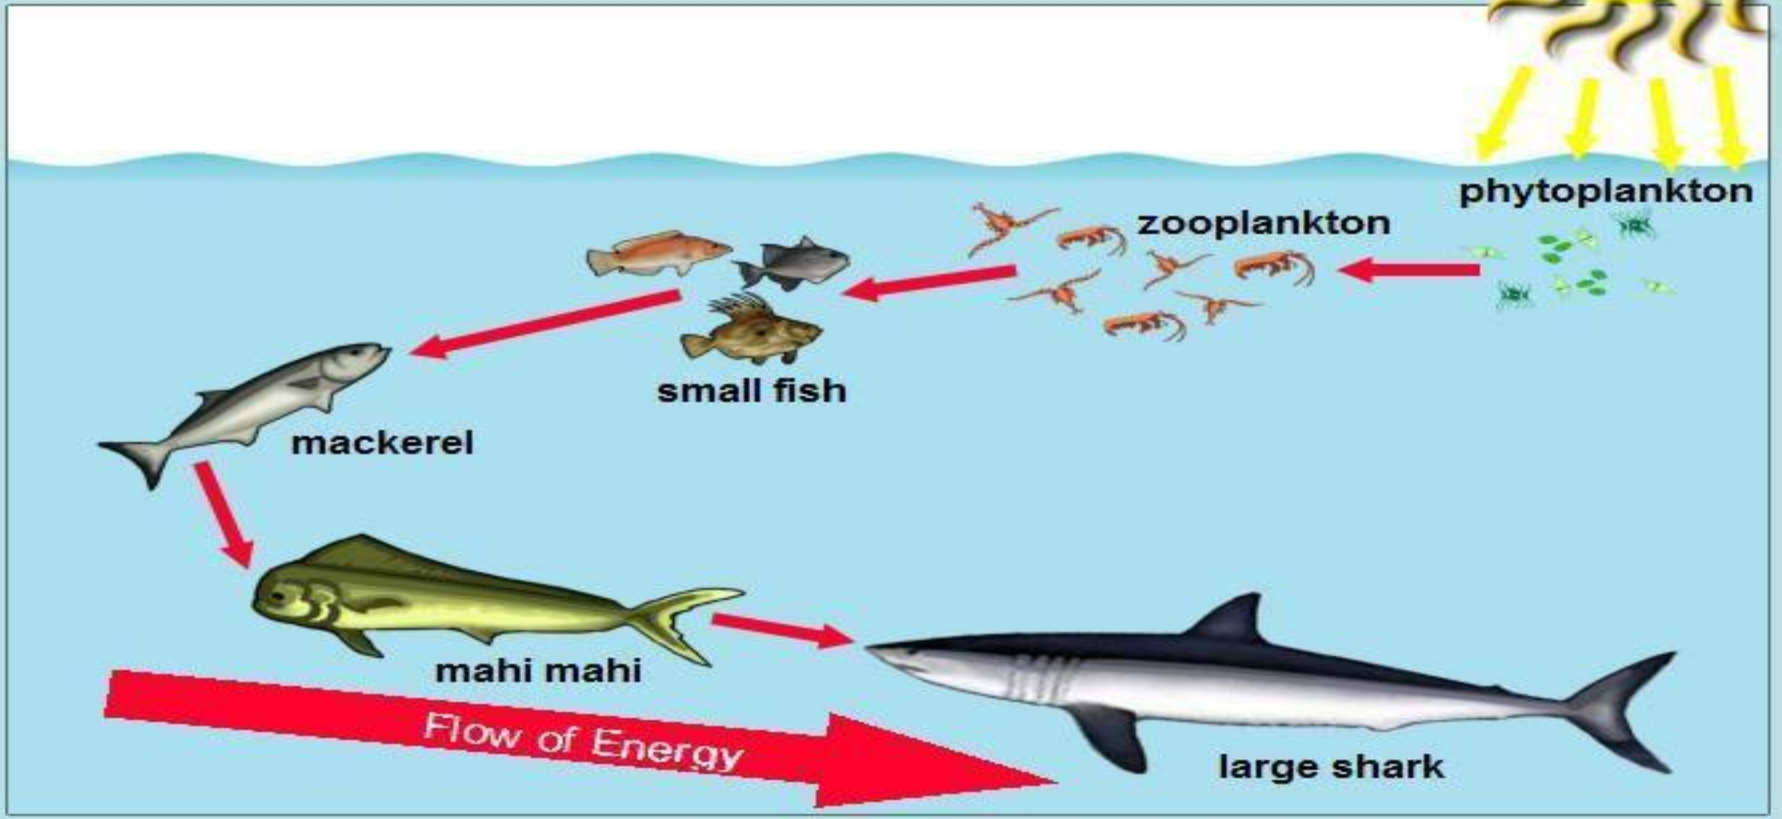
Sea turtles

Sharks

Coral

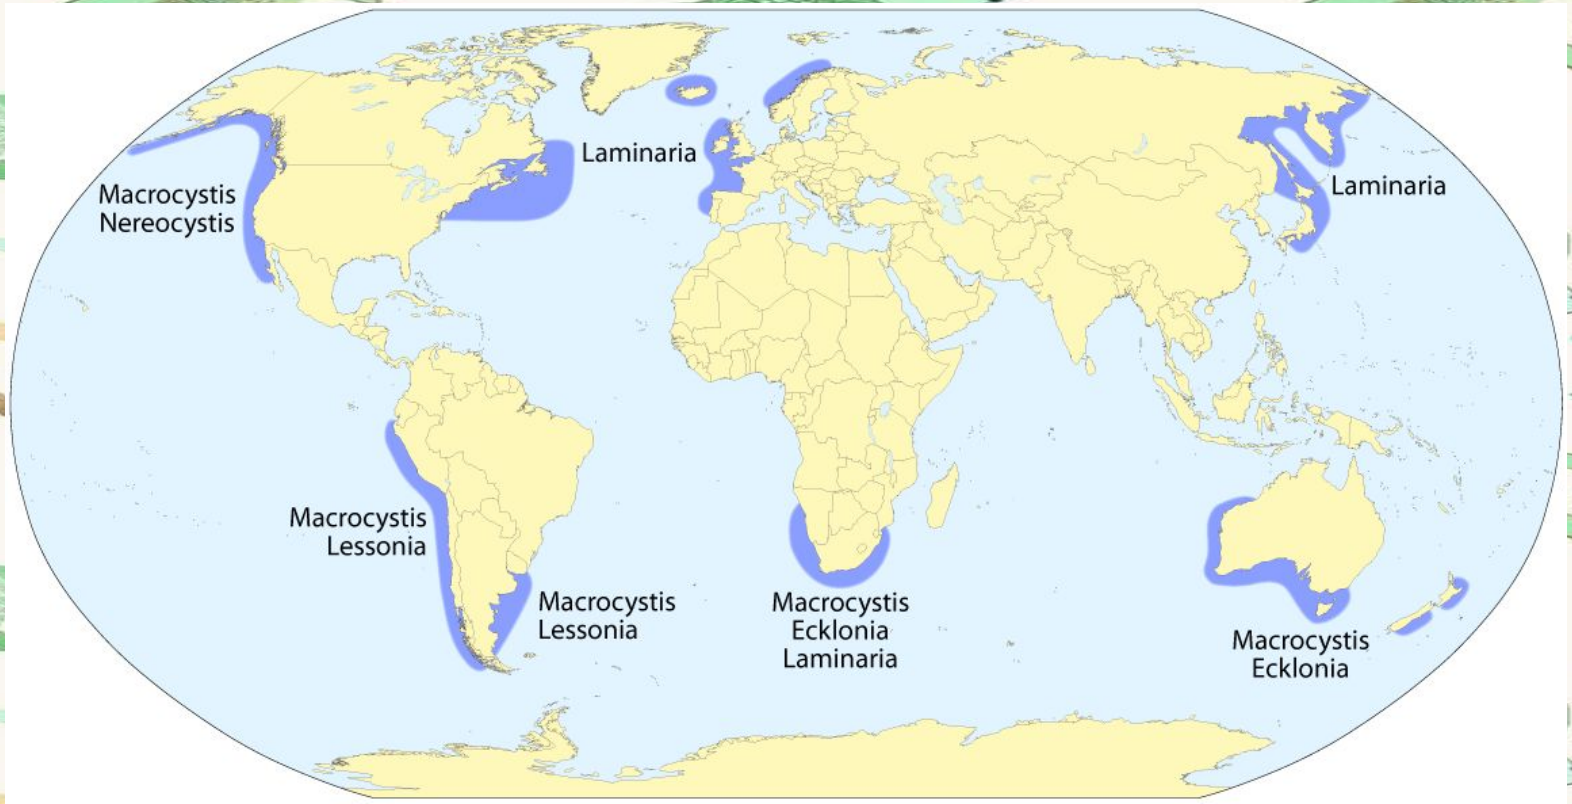
Rays

Food Chain



phytoplankton
zooplankton
small fish
mackerel
mahi mahi
Flow of Energy
large shark

Map



Macrocystis
Nereocystis
Laminaria
